A case of undiagnosed global LV hypokinesia in pneumonic patient

Dr. Niraj Khatri Sapkota

Chitwan Medical College, Iran

Patient of age 20 years old visited medicine OPD complaining of dyspnoea and dysphagia, diaphoresis with sign of tachypnea (21 breathe per minute) and tachycardia of 150 bpm with blood pressure 90/60 mm of Hg, he has history of 12 years pneumonia repeated treatment with recent diagnosis of tuberculosis, treated by anti tuberculosis medication before 6 months, his weight was 25 kg at the moment of visit, in his previous visit to different clinician, suspected to have cancer due to his reduced weight indication, due to dyspnoea symptoms, prescribed asthmatic medication which he undergone for 15 days for example salmeterol, ipratropium, emsolone, fluticasone before the visit to our OPD, during this course of medication his shortness of breathe exacerbated and along with difficulty in swallowing hence he forced to come to visit us.

During our OPD visit of his examination - He was suspected to suffer from multiple organ problem due to demonstrated symptomatic status like as tachycardia (heart beat of 150), dyspnoea, dysphagia (unable to swallow) and more focussed symptom was critical reduction in weight 25 kg in 10 years of time, hence he was referred to Cardiology department for further examination expecting that there must be involved of cardiac problem if not we will rule out it. On visit to cardiology department, Echo test was said to perform, not performed till his this age of 20 years, before visit to us.

Biography
